

Implement Client Script & UI Policy (Incident)

Milestone 5: Create onCellEdit Client Script

Description

Create an **onCellEdit Client Script** on the Incident table to control and validate field values when users edit Incident records directly from a **list view**. The script should check the updated value and allow or prevent the change based on the defined conditions. This helps maintain data accuracy and ensures that users follow the required validation rules even when making inline edits from the Incident list.

Activity 1: Create Client Script

Description

1. Navigate to Client Scripts:

Go to System UI → Client Scripts in your ServiceNow instance.

2. Click New to create a new Client Script.

3. Fill in the details:

- **Name:** Prevent state change via list edit – clearly indicates that the script prevents users from changing the State field directly in a list.
- **Table:** Incident – applies the script only to Incident records.
- **Type:** onCellEdit – runs whenever a field is edited directly in a list view.
- **Field name:** State – the script will monitor changes to the State field.
- **Active:** true – ensures the script is enforced immediately.

4. **Paste the script** into the script editor section. The script should prevent unauthorized changes to the State field when editing from the list view.

```
function onCellEdit(sysIDs, table, oldValues, newValue, callback)

{

    alert ('State cannot be updated using list editing. Please open the Incident.');
```

```
    callback(false);

}
```

5. **Click Submit** to save the Client Script.
6. **Verify:** Open an Incident list and try to change the State field directly in the list. The script should block the change as intended.
7. **Click Submit.**

The screenshot shows the ServiceNow interface for configuring a Client Script. The breadcrumb trail is "Client Script - New Record". The page title is "Client Script - Prevent state change via list edit". The configuration fields are as follows:

- Name:** Prevent state change via list edit
- Table:** Incident [incident]
- UI Type:** Desktop
- Type:** onCellEdit
- Field name:** (empty)
- Application:** Global
- Active:** ☒
- Inherited:** ☐
- Global:** ☒
- View:** (empty)
- Description:** (empty text area)
- Messages:** (empty text area)
- Script:**

```
function onCellEdit(sysIDs, table, oldValues, newValue, callback) {
    alert('State cannot be updated using list editing. Please open the Incident.');
```

```
    callback(false);
}
```
